

Roam. Milestone 5
04-03-2019

1. Section - 105-2
2. Team Name - Intravenous Caffeine
3. Team Member Names
 - a. Alex Tsalyuk
 - b. Andre Dugas
 - c. Ari Schermer
 - d. Sky (Logan) Howerter
 - e. Richard Diaz Bustos
4. The project plan can be found here: <https://github.com/users/andre495/projects/1> on the Roam. project page.

Test plans:

Features 1 & 2: Testing the “value-sliders” and the vacation database:

We will have a series of potential users who are not associated with developing the application (such as project developers’ friends and family) test out the value-sliders with their own personal values, and then allow the website to interface with the database to produce a vacation recommendation. Then, if it seems like the recommended vacation is in fact a vacation that is in line with their interests, we would consider that a UAT-success, otherwise, it would be a UAT-failure, and we will look in to adding more sliders, modifying our database, or changing our interfacing algorithm to better service potential users.

Feature 3: Testing the user-data history and logging:

New users should be prompted to create an account prior to running a vacation search. Existing users should be able to login to their account. After finding vacations they’d be interested in, users should be able to save those vacation profiles to their account. Users need to be able to check their profile for past vacation searches and re-open the results that Roam produced. UAT-success will be defined by users being able to access their account and view previous searches easily.
